Motorised Shutters

Ordering

The shutter is fitted around the outside of the window or door unit. You must provide the following dimensions:

Measure the overall window/door unit width (not just the glazing)

Measure the overall window/door unit height (not just the glazing)

Measure the overall window/door unit projection from the wall

The shutter requires the following clearances:

Sideroom: Standard shutters: 70mm to each side
Stand-off profile shutters: 90mm to each side

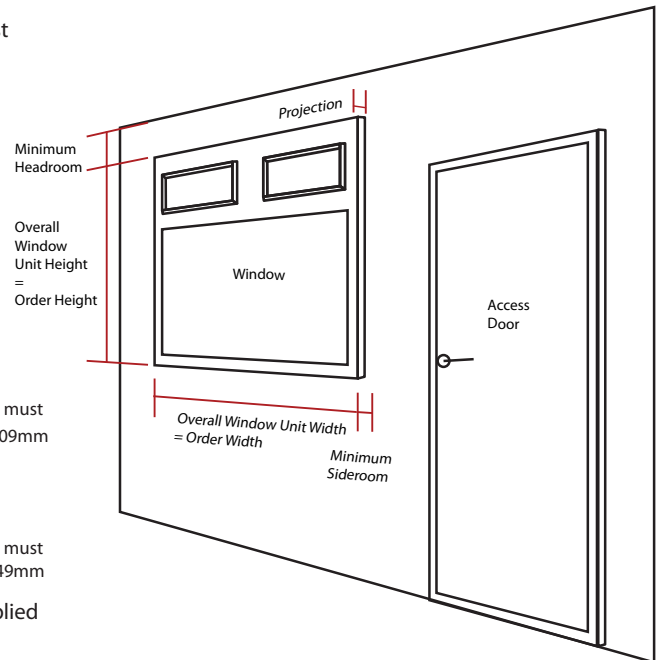

Headroom: 165mm box shutters < 1750mm high
(+44mm for stand-off profile shutters for fixing tab)

If full opening is required, allow an additional 44mm for an extra slat that must be retained in guide when the shutter is fully open. 165mm + 44mm = 209mm

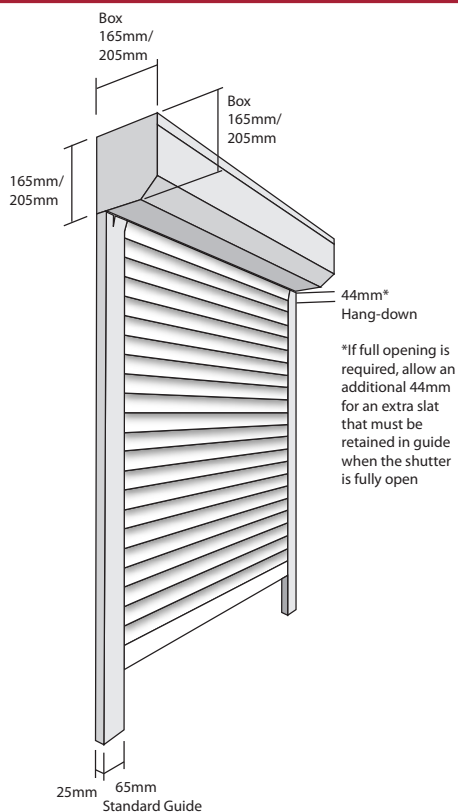

Headroom: 205mm box shutters ≥ 1750mm high
(+44mm if ordered with stand-off profile for fixing tab)

If full opening is required, allow an additional 44mm for an extra slat that must be retained in guide when the shutter is fully open. 205mm + 44mm = 249mm

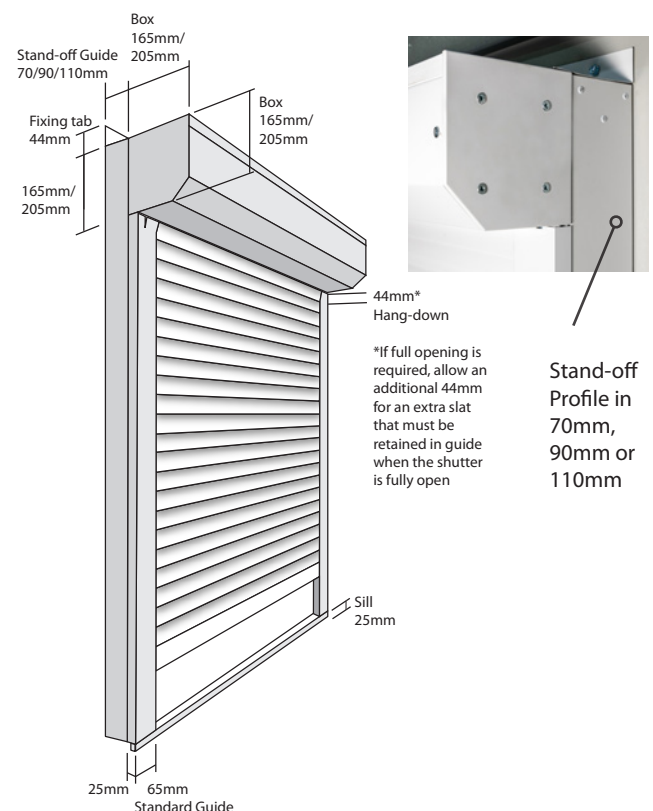

If the window/door projects from the wall, a stand-off profile kit can be supplied to allow the shutter to fix clear of the wall by 70, 90 or 110mm.

Standard Shutter

Shutter with stand-off profile kit

Sills

Window shutters supplied with the optional standoff kit come with an integrated sill (left image, also shows stand-off profile kit) and door shutters are supplied with mini sills (right image) for the curtain to rest at the threshold level with no trip hazard.
